GeN3 Installation Guide

What you need installed on you're server:

- You will need PHP 5.2:

GeN3 is always going to support the latest versions of PHP, so you should (if you haven't already) begin to upgrade to the latest PHP version as soon as it's released.

- CURL:

There's no version series for the "CURL" add-on, but CURL is mainly designed for bots. If you expect your PayPal AutoPay script to work CURL is required. AlertPay uses a slightly different method due to the heavy security but works perfectly.

- MySQL:

Please consider using the 5.x MySQL versions (not persistent please). Our script uses the least amount of resources and MySQL queried resources for best performance. Though this can affect site wide changes, it can also support a great load of server bills too. Reduced costs is what people want, So we took your ideas and integrated it into the script.

If you have all of them installed you won't have a problem at all.

-**SourceGuardian**

You can set this up in the directions below. Look at Step 7.

Directions:

1) Upload the contents of the 'Upload' directory to your root directory. MAKE SURE TO UPLOAD ALL FILES IN BINARY MODE OR IT WILL NOT WORK!

3) Give the files 'lib/lib_database.php' and 'lib/lib.php' and 'configuration.php' 777 rights. This can be done by using CHMOD.

3) Create your MySQL Database, and User.

4) Grant full access between your MySQL User and Database.

5) Import the files 'Install/database.sql' and 'Install/ip2country.sql.gz' into your database.

6) Edit your 'lib/lib_database.php' file and insert the details you made in step 3.

7) Edit 'lib/license.php' and insert your license into the license field. You can find the license at PTCPay.Com.

8) Make sure your SourceGuardian is installed correctly.Simply upload the '/install/SourceGuardian/howto-install.php' file to your root directory, run it in your browser, and

follow the directions. You can find it in your 'Install/SourceGuardian' directory.Ask your host to install this for you if you can't.

9) Visit your site. Your license will now be saved and a key created. Visit 'http://ptcpay.com/shop/client_login.php', view license, and download your key. You should also receive an email with your key file.

10)Upload this 'key.php' file to your script root directory.

6) Go to 'http://yourdomain.com/admin' and login using username 'admin'and password 'Dopy1234'.

7) Delete the 'Install' folder and all files under it.

8) Change your admin password and site settings.

9) After that, you should be done!

Any problems should be immediately reported in the forums under bug reports.

Thanks,

PTCPay.com Team
