GeN4 Automatic Installation Instructions

These are the automatic installer instructions. If you cannot get the installer to work, I suggest you install by using the 'Manual Instructions' file in the 'Information/Installation' directory.

1. Upload the contents of the 'Upload' directory to your public_html folder on your web host.

2. Make sure you have SourceGuardian installed before proceeding; you can find help on installing it by looking at step 7 in the 'Manual Installation' file.

3. CHMOD the 'lib' directory and all contents inside it to 777.

4. Go to http://yourdomain.com/install/index.php.

5. Create a new database and user using your host control panel, grant the user all rights.

6. Go back to your installer and fill in all the information you made in step 5.

7. You also will need your license, go to your control panel on PTCPay at http://ptcpay.com/store/customers/index.php?task=login and view your license after logging in. This license maybe reissued every time you need to install somewhere else.

8. Once you have input your license into the installer and completed all the steps, import the file "ip2country.sql.gz", found in the 'Information/Installation' directory, to your database.

9. Open the file called "Cron Jobs.pdf", found in the 'Information/Installation' directory, and follow the instructions to setup your cron jobs.

10. Go to http://yourdomain.com/. Your license will now be locked to your domain. You should receive an email with a key.php file to upload to your website. Upload the 'key.php' file to your root directory and 'lib' directory. You may re-download this file at anytime from your PTCPay control panel at http://ptcpay.com/store/customers/index.php?task=login.

10. Go to http://yourdomain.com/admin and edit all the settings to fit your needs. The default username Is *admin*, the default password is *Dopy1234*. Pay attention to capitalization.

11. If you need more directions or if this method does not work, read the "Manual Install" file also found in the 'Information/Installation' directory.

12. Delete the Install directory and all files under it.

13**. If you decide to enable Secure Admin in your admin panel, You must follow the directions called Secure_admin_instructions.txt, They are included in the 'Information/Installation' directory (same as these instructions).**
